CRICKET PLAYER PERFORMANCE TRACKING APPLICATION

1. Salesforce Developer Account Creation

Introduction

Salesforce is a cloud-based platform used to develop and manage business applications. For the Cricket Player Performance Tracking Application, Salesforce Developer Account is used as the development environment. It provides various features such as custom objects, fields, relationships, Lightning Apps, Flows and Roll-up Summary fields.

The application is designed to maintain cricket player details and track their performance in different matches.

Activity 1: Creating Developer Account

A Salesforce Developer Account is created to develop and configure the application.

Steps:

Open the Salesforce Developer website.

Select the option to create a new account.

Enter the required details such as:

First Name

Last Name

Email

Username

Country

Postal Code

Accept the required terms and conditions.

Click Sign Up.

A confirmation email is sent to the registered email address.

Open the email and continue with the account activation process.

Activity 2: Account Activation

After creating the developer account, the account must be activated.

Steps:

Open the activation email received from Salesforce.

Click the activation link.

Create a secure password.

Confirm the password.

Complete the required security information.

Login to Salesforce using the registered username and password.

The Salesforce Developer environment is now ready for application development.

2. Fields & Relationships

Fields and Relationships are used to store and connect data in Salesforce. In this project, custom fields are created for the Player and Match Performance objects.

Activity 1: Create Custom Fields for Player Object

The Player object stores information about individual cricket players.

Important Player Fields

Field Name

Data Type

Purpose

Player Name

Text

Stores player name

Player ID

Auto Number

Unique player identification

Age

Number

Stores player’s age

Team

Text

Stores team name

Role

Picklist

Batsman/Bowler/All-rounder/Wicket Keeper

Matches Played

Number

Number of matches played

Total Runs

Number

Total runs scored

Total Wickets

Number

Total wickets taken

These fields help the administrator maintain complete information about every player.

Activity 2: Create Custom Fields for Match Performance Object

The Match Performance object stores the performance of a player in each match.

Important Match Performance Fields

Field Name

Data Type

Purpose

Match Name

Text

Name or number of match

Player

Lookup Relationship

Connects performance with Player

Runs

Number

Runs scored

Balls Faced

Number

Balls faced

Wickets

Number

Wickets taken

Overs

Number

Overs bowled

Catches

Number

Catches taken

Match Date

Date

Date of the match

The relationship between Player and Match Performance allows multiple match-performance records to be associated with a player.

3. Roll-up Summary

A Roll-up Summary field is used to calculate values from related records. It can perform calculations such as COUNT, SUM, MIN and MAX.

In the Cricket Player Performance Tracking Application, Roll-up Summary is used to calculate the overall performance of a player from the related Match Performance records.

Activity: Create Roll-up Summary for Player Object

A Roll-up Summary field can be created in the Player object to calculate the total runs scored by a player.

Steps

Open Setup in Salesforce.

Go to Object Manager.

Select the Player object.

Select Fields & Relationships.

Click New.

Select Roll-Up Summary as the field type.

Enter the field label as Total Runs.

Select the related Match Performance records.

Select SUM as the calculation type.

Select the Runs field.

Save the field.

The total runs from all related match-performance records are automatically calculated and displayed in the Player record.

Benefits

Reduces manual calculations.

Automatically updates player statistics.

Helps track overall performance.

Provides accurate performance information.

Saves time for administrators.

4. The Lightning App

Salesforce Lightning App is used to provide a customized interface for users. A Lightning App can contain objects, tabs and other Salesforce features required for the application.

For this project, a Lightning App named Cricket Player Performance Tracking is created.

Activity: Create a Lightning App

Steps

Open Salesforce Setup.

Search for App Manager.

Click New Lightning App.

Enter the App Name as Cricket Player Performance Tracking.

Enter a suitable description.

Select the required navigation items.

Add the required objects such as:

Player

Match Performance

Configure the app navigation.

Select the required user profiles.

Click Save & Finish.

Application Navigation

The application can provide navigation tabs such as:

Home → Players → Match Performance → Reports → Dashboards

This makes it easier for users to access player and performance information.

Advantages

Simple and user-friendly interface.

Easy access to Player records.

Easy access to Match Performance records.

Provides centralized application navigation.

Improves data management.

5. Flows

Salesforce Flow is an automation tool used to perform actions automatically. It can collect information from users, create records, update records and display information.

In this project, two types of Flows are used:

Screen Flow

Flow on Home Page

Activity 1: Screen Flow

Screen Flow is used to interact with users through screens. It can collect player or match-performance information and create records.

Purpose

The Screen Flow can be used to enter a player's match performance details.

Steps

Open Setup.

Search for Flows.

Click New Flow.

Select Screen Flow.

Create a screen for entering performance details.

Add fields such as:

Player

Match Name

Runs

Wickets

Balls Faced

Catches

Add a Create Records element.

Select the Match Performance object.

Map the entered values to the corresponding fields.

Connect the screen and create-record elements.

Save the Flow.

Debug and test the Flow.

Activate the Flow.

Result

The user can enter match-performance information through the screen, and the information is stored automatically in the Match Performance object.

6. Flow on Home Page

A Flow can also be placed on the Salesforce Home Page so that users can access it directly after opening the application.

Steps

Create and activate the required Flow.

Open Lightning App Builder.

Select the Home Page.

Click Edit.

Select the Flow component.

Drag and drop the Flow component onto the page.

Select the required Flow.

Configure the Flow settings.

Click Save.

Activate the Home Page.

Result

The Flow is displayed directly on the Home Page. Users can perform the required activity without navigating through multiple pages.

7. Overall Application Working

The Cricket Player Performance Tracking Application is designed to maintain player information and monitor cricket performance.

The basic workflow of the application is:

Salesforce Developer Account

↓

Lightning App

↓

Player Object

↓

Match Performance Object

↓

Fields & Relationships

↓

Roll-up Summary

↓

Flows

↓

Performance Tracking

The Player Object stores basic player information. The Match Performance Object stores individual match statistics. The relationship between these objects connects each performance record with the corresponding player.

The Roll-up Summary automatically calculates important statistics such as total runs. Flows help users enter performance information easily and automate record creation. The Lightning App provides a centralized interface for accessing all these features.

8. Conclusion

The Cricket Player Performance Tracking Application provides a structured way to manage cricket player information and performance records using Salesforce. The application uses Salesforce features such as Custom Fields, Relationships, Roll-up Summary, Lightning App and Flows.

The Player object maintains player details, while the Match Performance object stores match-wise statistics. Roll-up Summary helps calculate overall player performance

automatically. Screen Flow simplifies data entry, and the Flow placed on the Home Page provides quick access to important functions.

Thus, the application helps in maintaining player records, tracking match performance and reducing manual calculations through Salesforce automation.
